

## Municipal Waste and Recycling Efficiency

This project analysed municipal waste and recycling efficiency across different countries using data from Our World in Data and Eurostat.

Korea has the highest recycling rate; it's nearly 60%, and Germany has the second-highest recycling rate; it's nearly 47%. According to the data, the global recycling rate has been gradually increasing since 1990.

A linear regression model was trained to predict the recycling rate as a function of year. The model achieved 97% accuracy and predicts that the global recycling rate will reach 33.78% by 2028.

Finally, I learned how to create an SQLite database, write SQL queries, perform data visualisation with matplotlib and seaborn, and build a machine learning model using scikit-learn.
